

1 INTERACTIVE v1 WORKLOAD

The Interactive v1 workload consists of a set of relatively complex read-only queries, that touch a significant amount of data – often the two-step friendship neighbourhood and associated messages –, but typically in close proximity to a single node. Hence, the query complexity is sublinear to the dataset size.

The LDBC SNB Interactive workload consists of three query classes:

- **Complex read-only queries.** See Section 1.1.
- **Short read-only queries.** See Section 1.2.
- **Insert operations.** See Section 1.3.

Related Publications

A detailed description of the workload (covering reads and inserts) is available in the paper published at SIGMOD 2015 [1]. The ACID Test Suite was first published at TPCTC 2020 [2].

relevance	This query is a representative of a simple navigational query. It is interesting for several aspects. (1) It requires for a complex aggregation for returning the concatenation of universities, companies, languages and email information of the Person. (2) It tests the ability of the optimizer to move the evaluation of sub-queries functionally dependant on the Person, after the evaluation of the top-k. (3) Its performance is highly sensitive to properly estimating the cardinalities in each transitive path, and paying attention not to explore already visited Persons.

		4	message.id	ID	R
		5	message.content or message.imageFile (for photos)	Text	R
		6	message.creationDate	DateTime	R
	sort	1	message.creationDate	↓	
		2	message.id	↑	
	limit	20			
	CPs	1.1, 2.2, 2.3, 3.2, 8.5			
	relevance	This is a navigational query looking for paths of length two, starting from a given Person, going to their friends and from them, moving to their published Posts and Comments. This query exercises both the optimizer and how data is stored. It tests the ability to create execution plans taking advantage of the orderings induced by some operators to avoid performing expensive sorts. This query requires selecting Posts and Comments based on their creation date, which might be correlated with their identifier and therefore, having intermediate results with interesting orders. Also, messages could be stored in an order correlated with their creation date to improve data access locality. Finally, as many of the attributes required in the projection are not needed for the execution of the query, it is expected that the query optimizer will move the projection to the end.

query	Interactive / complex / 3				
title	Friends and friends of friends that have been to given countries				
pattern	<p>The diagram illustrates the query pattern. It starts with a person: Person entity with attribute <code>id = \$personId</code>. This person knows*1..2 otherPerson: Person entities. Each otherPerson has attributes <code>id</code>, <code>firstName</code>, and <code>lastName</code>. Each otherPerson hasCreator Message entities. There are two Message entities shown, each with a filter: <code>\$startDate ≤ creationDate < \$startDate + \$durationDays</code>. Each Message isLocatedIn Country entities. The two Country entities are countryX: Country (with <code>name = \$countryXName</code>) and countryY: Country (with <code>name = \$countryYName</code>). Both Country entities isPartOf a City entity. Red dashed arrows labeled <code>«neg» isPartOf</code> indicate that the Country entities are not part of the City.</p>				
description	Given a start Person with ID <code>\$personId</code> , find Persons that are their friends and friends of friends (excluding the start Person) that have made Posts / Comments in both of the given Countries (named <code>\$countryXName</code> and <code>\$countryYName</code>), within <code>[\$startDate, \$startDate + \$durationDays)</code> (closed-open interval). Only Persons that are foreign to these Countries are considered, that is Persons whose location Country is neither named <code>\$countryXName</code> nor <code>\$countryYName</code> .				
params	1	<code>\$personId</code>	ID		
	2	<code>\$countryXName</code>	String	In SNB Interactive v2, this query has two variants: (a) Correlated Countries (b) Anti-correlated Countries	
	3	<code>\$countryYName</code>	String		
	4	<code>\$startDate</code>	Date	Beginning of requested period	
	5	<code>\$durationDays</code>	32-bit Integer	Duration of requested period, in days. The interval <code>[\$startDate, \$startDate + \$durationDays)</code> is closed-open	
result	1	<code>otherPerson.id</code>	ID	R	
	2	<code>otherPerson.firstName</code>	String	R	
	3	<code>otherPerson.lastName</code>	String	R	
	4	<code>xCount</code>	32-bit Integer	A	Number of Messages from Country named <code>\$countryXName</code> created by the Person within the given time
	5	<code>yCount</code>	32-bit Integer	A	Number of Messages from Country named <code>\$countryYName</code> created by the Person within the given time
	6	<code>count</code>	32-bit Integer	A	<code>count = xCount + yCount</code>
sort	1	<code>count</code>	↓		
	2	<code>otherPerson.id</code>	↑		
limit	20				
CPs	2.1, 3.1, 5.1, 8.2, 8.5				
relevance	This query looks for paths of length two and three, starting from a Person, going to friends or friends of friends, and then moving to Messages. This query tests the ability of the query optimizer to select the most efficient join ordering, which will depend on the cardinalities of the intermediate results. Many friends of friends can be duplicate, then it is expected to eliminate duplicates and those people prior to access the Post and Comments, as well as eliminate those friends from Countries named <code>\$countryXName</code> and <code>\$countryYName</code> , as the size of the intermediate results can be severely affected. A possible structural optimization could be to materialize the number of Posts and Comments created by a Person, and progressively filter those people that could not even fall in the top 20 even having all their posts in the Countries named <code>\$countryXName</code> and <code>\$countryYName</code> .

IC 6						
IC 7						
IC 8						
IC 9						
IC 10	description	Given a start Person with ID \$personId, find Tags that are attached to Posts that were created by that Person’s friends. Only include Tags that were attached to friends’ Posts created within a given time interval [\$startDate, \$startDate + \$durationDays) (closed-open) and that were never attached to friends’ Posts created before this interval.				
IC 11						
IC 12						
IC 13						
IC 14v1	params	1	\$personId	ID		
IC 14v2		2	\$startDate	Date		
	3	\$durationDays	32-bit Integer	Duration of requested period, in days. The interval [\$startDate, \$startDate + \$durationDays) is closed-open		
	result	1	tag.name	Long String	R	Number of Posts made within the given time interval that have tag
		2	postCount	32-bit Integer	A	
	sort	1	postCount	↓		
		2	tag.name	↑		
	limit	10				
	CPs	2.3, 8.2, 8.5				
	relevance	This query looks for paths of length two, starting from a given Person, moving to Posts and then to Tags. It tests the ability of the query optimizer to properly select the usage of hash joins or index based joins, depending on the cardinality of the intermediate results. These cardinalities are clearly affected by the input Person, the number of friends, the variety of Tags, the time interval and the number of Posts.				

Interactive / complex / 5

IC 1	query	Interactive / complex / 5			
IC 2	title	New groups			
IC 3	pattern				
IC 4					
IC 5					
IC 6					
IC 7					
IC 8	description	Given a start Person with ID \$personId, denote their friends and friends of friends (excluding the start Person) as otherPerson.			
IC 9		Find Forums that any Person otherPerson became a member of after a given date (\$minDate). For each of those Forums, count the number of Posts that were created by the Person otherPerson.			
IC 10					
IC 11					
IC 12					
IC 13	params	1	\$personId	ID	
IC 14v1		2	\$minDate	Date	
IC 14v2	result	1	forum.title	Long String	R
		2	postCount	32-bit Integer	A
	sort	1	postCount	↓	
		2	forum.id	↑	
	limit	20			
	CPs	2.3, 3.3, 8.2, 8.5			
	relevance	This query looks for paths of length two and three, starting from a given Person, moving to friends and friends of friends, and then getting the Forums they are members of. Besides testing the ability of the query optimizer to select the proper join operator, it rewards the usage of indices, but their accesses will be presumably scattered due to the two/three-hop search space of the query, leading to unpredictable and scattered index accesses. Having efficient implementations of such indices will be highly beneficial.

	sort	<table><tr><td>1</td><td><code>likes.creationDate</code></td><td>↓</td><td></td></tr><tr><td>2</td><td><code>friend.id</code></td><td>↑</td><td></td></tr></table>			1	<code>likes.creationDate</code>	↓		2	<code>friend.id</code>	↑																														
1		<code>likes.creationDate</code>	↓																																						
2	<code>friend.id</code>	↑																																							
	limit	20																																							
	CPs	2.2, 2.3, 3.3, 5.1, 8.1, 8.3																																							
	relevance	<p>This query looks for paths of length two, starting from a given Person, moving to its published messages and then to Persons who liked them. It tests several aspects related to join optimization, both at query optimization plan level and execution engine level. On the one hand, many of the columns needed for the projection are only needed in the last stages of the query, so the optimizer is expected to delay the projection until the end. This query implies accessing two-hop data, and as a consequence, index accesses are expected to be scattered. We expect to observe variate cardinalities, depending on the characteristics of the input parameter, so properly selecting the join operators will be crucial. This query has a lot of correlated sub-queries, so it is testing the ability to flatten the query execution plans.</p>																																							

Interactive / complex / 8

IC 14v1

IC 14v2

query	Interactive / complex / 12																													
title	Expert search																													
pattern																														
description	Given a start Person with ID \$personId, find the Comments that this Person’s friends made in reply to Posts, considering only those Comments that are direct (single-hop) replies to Posts, not the transitive (multi-hop) ones. Only consider Posts with a Tag in a given TagClass with name \$tagClassName or in a descendant of that TagClass. Count the number of these reply Comments, and collect the Tags that were attached to the Posts they replied to, but only collect Tags with the given TagClass or with a descendant of that TagClass. Return Persons with at least one reply, the reply count, and the collection of Tags.																													
params	<table><tr><td>1</td><td>\$personId</td><td>ID</td><td></td></tr><tr><td>2</td><td>\$tagClassName</td><td>Long String</td><td></td></tr></table>					1	\$personId	ID		2	\$tagClassName	Long String																		
1	\$personId	ID																												
2	\$tagClassName	Long String																												
result	<table><tr><td>1</td><td>friend.id</td><td>ID</td><td>R</td><td></td></tr><tr><td>2</td><td>friend.firstName</td><td>String</td><td>R</td><td></td></tr><tr><td>3</td><td>friend.lastName</td><td>String</td><td>R</td><td></td></tr><tr><td>4</td><td>tagNames</td><td>{Long String}</td><td>A</td><td></td></tr><tr><td>5</td><td>replyCount</td><td>32-bit Integer</td><td>A</td><td></td></tr></table>					1	friend.id	ID	R		2	friend.firstName	String	R		3	friend.lastName	String	R		4	tagNames	{Long String}	A		5	replyCount	32-bit Integer	A	
1	friend.id	ID	R																											
2	friend.firstName	String	R																											
3	friend.lastName	String	R																											
4	tagNames	{Long String}	A																											
5	replyCount	32-bit Integer	A																											
sort	<table><tr><td>1</td><td>replyCount</td><td>↓</td><td></td></tr><tr><td>2</td><td>friend.id</td><td>↑</td><td></td></tr></table>					1	replyCount	↓		2	friend.id	↑																		
1	replyCount	↓																												
2	friend.id	↑																												
limit	20																													
CPs	3.3, 7.2, 7.3, 8.2																													
relevance	This query starts at a Person, moves to its friends, and the to their Comments and their root Posts. Then, it gets the Tag of each Post and checks whether it (directly or transitively) belongs to the specified TagClass. This can be thought of a bidirectional search between the Person and the TagClass. The difficulty of this query is determining the optimal direction of this traversal.																													

Interactive / complex / 13

IC 1	query	Interactive / complex / 13			
IC 2	title	Single shortest path			
IC 3	pattern				
IC 6	description	Given two Persons with IDs \$person1Id and \$person2Id, find the shortest path between these two Persons in the subgraph induced by the knows edges. Return the length of this path:			
IC 7		<ul style="list-style-type: none">• -1: no path found• 0: start person = end person• > 0: path found (start person ≠ end person)			
IC 8					
IC 9					
IC 10					
IC 11	params	1	\$person1Id	ID	In SNB Interactive v2, this query has two variants: (b) Guaranteed that there is no path between the two Persons (b) Guaranteed that there is a 4-hop path between the two Persons
IC 12		2	\$person2Id	ID	
IC 13	result	1	shortestPathLength	32-bit Integer	C
IC 14v1	CPs	3.3, 7.2, 7.3, 7.5, 7.8, 8.1, 8.6			
IC 14v2	relevance	This query looks for a variable length path, starting at a given Person and finishing at an another given Person. Proper cardinality estimation and search space pruning, will be crucial. This query also allows for possible parallel implementations.			

Interactive / complex / 14v1

IC 1	query	Interactive / complex / 14v1		
IC 2	title	Trusted connection paths (v1)		
IC 3	pattern	<div>Enumerate all unweighted shortest paths on knows edges from person1 to person2. For each edge on the path, calculate a weight based on interactions between the pair of Persons of the edge as a sum of cases #1 and #2 for the Persons (both ways), and the sum of these weights determine the total weight of each path.</div> <div><div>person1: Person id = \$person1Id</div><div>knows*</div><div>person2: Person id = \$person2Id</div></div> <div><div>Case 1: Replies on Posts, 1.4 Workload Definition

The *Test Driver* is in charge of the execution of the Interactive Workload. At the beginning of the execution, the Test Driver creates a query mix by assigning to each query instance, a query issue time and a set of parameters taken from the generated substitution parameter set described above.

Query issue times have to be carefully assigned. Although substitution parameters are chosen in such a way that queries of the same type take similar time, not all query types have the same complexity and touch the same amount of data, which causes them to scale differently for the different scale factors. Therefore, if all query instances, regardless of their type, are issued at the same rate, those more complex queries will dominate the execution's result, making faster query types purposeless. To avoid this situation, each query type is executed at a different rate. The way the execution rate is decided, also depends on the nature of the query: complex read, short read or update.

Update queries' issue times are taken from the update streams generated by the data generator. These are the times where the actual event happened during the simulation of the social network. Complex reads' times are expressed in terms of update operations. For each complex read query type, a frequency value is assigned which specifies the relation between the number of updates performed per complex read. Table 1.1 shows the frequencies for each complex query and SF used in the Interactive v1 workload (Chapter 1).

Query	SF1	SF3	SF10	SF30	SF100	SF300	SF1 000	SF3 000
1	26	26	26	26	26	26	26	26
2	37	37	37	37	37	37	37	37
3	69	79	92	106	123	142	165	189
4	36	36	36	36	36	36	36	36
5	57	61	66	72	78	84	91	98
6	129	172	236	316	434	580	796	1063
7	87	72	54	48	38	32	25	21
8	45	27	15	9	5	3	1	1
9	157	209	287	384	527	705	967	1292
10	30	32	35	37	40	44	47	51
11	16	17	19	20	22	24	26	28
12	44	44	44	44	44	44	44	44
13	19	19	19	19	19	19	19	19
14	49	49	49	49	49	49	49	49

Table 1.1: Frequencies for each Interactive complex query and SF.

Finally, short reads are inserted in order to balance the ratio between reads and writes, and to simulate the behavior of a real user of the social network. For each complex read instance, a sequence of short reads is planned. There are two types of short read sequences: Person centric and Message centric. Depending on the type of the complex read, one of them is chosen. Each sequence consists of a set of short reads which are issued in a row. The issue time assigned to each short read in the sequence is determined at run time, and is based on the completion time of the complex read it depends on. The substitution parameters for short reads are taken from the results of previously executed queries, including both complex and short reads:

- Complex reads: IC 1 IC 2 IC 3 IC 7 IC 8 IC 9 IC 10 IC 11 IC 12 IC 14v1 IC 14v2
- Short reads: IS 2 IS 3 IS 5 IS 6 IS 7

To see which short and complex queries can potentially trigger additional short query queries, see Table 1.2.

Once a short read sequence is issued (and provided that sufficient substitution parameters exist), there is a probability that another short read sequence is issued. This probability decreases for each new sequence issued.¹ Since the same random number generator seed is used across executions, the workload is deterministic.

	IS 1	IS 2	IS 3	IS 4	IS 5	IS 6	IS 7
IC 1	⊗	⊗	⊗

IS 2	⊗	⊗	⊗	⊗	⊗	⊗	⊗
IS 3	⊗	⊗	⊗				
IS 5	⊗	⊗	⊗				
IS 6	⊗	⊗	⊗				
IS 7	⊗	⊗	⊗	⊗	⊗	⊗	⊗

Table 1.2: Short read queries (columns) potentially triggered after given complex/short read queries (rows).

The specified frequencies, implicitly define the query ratios between queries of different types, as well as a default target throughput. However, the Test Sponsor may specify a different target throughput to test, by “squeezing” together or “stretching” apart the queries of the workload. This is achieved by means of the “Time Compression Ratio” that is multiplied by the frequencies (see Table 1.1). Therefore, different throughputs can be tested while maintaining the relative ratios between the different query types.

Warning. Note that in the current implementation of SNB Interactive v1, short queries are only produced if updates are enabled. In the absence of updates, no short queries will be executed.

¹The probability can be adjusted using the `ldbc.snb.interactive.short_read_dissipation` configuration option.
