query	BI / read / 17				
title	Information propagation analysis				
pattern					
description	This query aims to identify instances of “information propagation” when a Person (person1) submits a Message (message1) with a given \$tag to a Forum (forum1). This is read by other members of forum1, Persons person2 and person3 (who must be different Persons). Some time later (specified by the \$delta parameter), these persons have a discussion with the same \$tag in a different Forum (forum2) where person1 is not a member. The discussion consists of a Message (message2) by person2 and a direct reply Comment (comment) by person3. Return IDs of person1 with the number of interactions their Messages (might have) caused.				
params	1	\$tag	Long String	Tags with a similar amount of Messages are selected	
	2	\$delta	32-bit Integer	Measured in hours, selected to be between 8 and 16 hours.	
result	1	person1.id	ID	R	
	2	messageCount	32-bit Integer	A	
sort	1	messageCount	↓		
	2	person1.id	↑		
limit	10				
CPs	2.1, 2.3, 2.5, 2.6, 8.1
